# Nobex Promaster Framing Kit

*Good framing is always judged on the quality of the corners- in other words how neat the join is. For those making frames, it is the ease and consistency of being able to move from accurate cut to the join that is essential. And it is the mitre cutter that is key to creating accurate, tight fitting joins.*

The **Nobex Promaster Framing Kit** includes all the tool elements needed to measure, clamp and cut mitre lengths accurately, providing a great way to start making quality frames:

- NOBEX Proman 110, mitre saw,
- NOBEX X-act Framing extension and
- NOBEX PRM 4-8 picture framing clamp.

There are many mitre saws available on the market today and, whilst most of them are quite suitable for the home handyman, very few provide the accuracy required for Picture Framing. The Swedish designed NOBEX® Mitre Saws are the exception and in our opinion, these are the best saws on the market for the price.

**diy**  
framing™

[www.diyframing.com](http://www.diyframing.com)

**The Nobex Proman 110** is a precision mitre saw with a fast action clamp for mouldings and pre set lockings for 4, 5, 6, 8 and 12 corners and for 90. The saws also feature a clamp to hold the work firmly in place and a "parking" feature to allow accurate alignment of the work with the saw blade supported above the surface of the moulding. Bases are made from quality aluminium and each unit is supplied with an adjustable length stop for accurate cutting of materials.

## The Nobex X-Act Measure System

provides an extension arm, which can be fitted to either side of the mitre system base. It features a simple / accurate system to allow accurate measurement of mitred frame lengths and ensure opposite sides are the same.
